

# C4AF, Radial, 2 or 4 Leads, 250 – 400 VAC, for Harsh Environment AC Filtering (Automotive Grade)

## Overview

C4AF are polypropylene metallized film capacitors that are rectangular shape, with a plastic box-type design (white or grey in color), filled with resin and have 2 or 4 tinned copper wires. These capacitors are intended to withstand harsh environmental conditions.

Automotive grade devices meet the demanding Automotive Electronics Council's AEC-Q200 qualification requirements.

## Applications

Typical applications include clamping, AC and harmonic filtering in UPS systems, motor drives, renewable energy, and automotive systems.

## Benefits

- Self-healing
- Low losses
- High ripple current
- High contact reliability
- Optimized AC voltage performance
- Suitable for high frequency applications
- Able to withstand harsh environmental conditions
- Automotive grades (AEC-Q200)

## Part Number System

C4	A	F	1	B	W	5330	A	3	N	J
Series	Type	Application	Rated Voltage (VAC)	Case	Terminals Code	Capacitance Code (pF)	C-Spec	Lead Diameter (mm)	Size Code: B x H x L (mm)	Tolerance
C4 = MKP Power Capacitors	A = Box, wire terminals	F = AC filtering	1 = 250 9 = 310 7 = 350 3 = 400	B = Box plastic case E = Box plastic case, extended (> 35 x 50 x 57.5)	U = 2 pins W = 4 pins	Digits 2 – 4 indicate the first three digits of the capacitance value. First digit indicates the number of zeros to be added.	A = Standard Grade	1 = 0.8 3 = 1.2	Digit 6 = B W = 11 x 20 x 31.5 X = 13 x 25 x 31.5 Y = 14 x 28 x 31.5 1 = 19 x 29 x 31.5 2 = 22 x 37 x 31.5 F = 20 x 40 x 42 J = 28 x 37 x 42 L = 30 x 45 x 42 M = 30 x 45 x 57.5 N = 35 x 50 x 57.5  Digit 6 = E A = 45 x 56 x 57.5 B = 45 x 65 x 57.5	J = 5% K = 10%

## Qualification

Reference Standards	IEC 61071, EN 61071, VDE0560
Climatic Category	55/105/56 according to IEC 60068-1

Automotive grade products meet or exceed the requirements outlined by the Automotive Electronics Council. Details regarding test methods and conditions are referenced in document AEC-Q200, Stress Test Qualification for Passive Components. For additional information regarding the Automotive Electronics Council and AEC-Q200, please visit their website at [www.aecouncil.com](http://www.aecouncil.com).

## General Technical Data

Dielectric	Polypropylene metallized film, non-inductive type, self-healing property
Application	AC Filtering (250 VAC, 310 VAC, 350 VAC, 400 VAC) 250 VAC rating recommended ONLY for controlled output filtering
Special Features	AEC-Q200 qualified
Climatic Category	55/105/56 IEC 60068-1
Maximum Operating Temperature	105 °C
Lower Operating Temperature	-55°C
Standard	IEC 61071, EN 61071, VDE0560, AEC-Q200
Protection	Solvent resistant plastic case UL 94 V-0 compliant Thermosetting resin sealing UL 94 V-0 compliant
Installation	Any position
Leads	Tinned copper wires - standard lead wire length 6 (+0/-2) mm
Packaging	Packed in cardboard trays with protection for the terminals
RoHS Compliance	Compliant with the restricted substance requirements of Directive 2011/65/EU

## Electrical Characteristics

Rated Capacitance Range	1 to 62 $\mu$ F
Rated Voltage (VNAC) Range	250 to 400 VAC (50/60 Hz)
Capacitance Tolerance	$\pm 5\%$ (J) or $\pm 10\%$ (K) measured at T = +25°C $\pm 5^\circ$ C
Dissipation Factor PP Maximum (tg $\delta$ )	$\leq 0.0007$ with T = 25°C $\pm 5^\circ$ C
Surge Voltage	$1.5 * V_{NDC}$ for maximum 10 times in lifetime at T = 25°C $\pm 5^\circ$ C
Overvoltage (IEC 61071)	$1.15 * V_{NDC}$ for maximum 30 minutes, once per day
	$1.3 * V_{NDC}$ for maximum 1 minute, once per day
Peak Non-Repetitive Current	$1.5 * I_{PKR}$ for maximum 1,000 times in lifetime
Insulation Resistance	$IR \times C \geq 30,000$ seconds at 100 VDC 1 minute at T = +25°C, $\pm 5^\circ$ C
Capacitance Deviation in the operating temperature range -55 to 105°C	$\pm 2.5\%$ maximum on capacitance value measured at T = +25°C, $\pm 5^\circ$ C
Temperature Storage	-40 to +80°C
Storage time	$\leq 36$ months from the date marked on the label glued to the package
Permissible Relative Humidity - Storage	Annual average $\leq 70\%$ , 85% on 30 days/year randomly distributed throughout year. Dewing not admissible.

## Life Expectancy

Life Expectancy	≥ 60,000 hours at $V_{NAC}$ and $T_{HS} = +85^{\circ}\text{C}$
Capacitance Drop at End of Life	-5% (typical)
Failure Rate	See Life Expectancy/Failure Quota Graphs

## Test Method

Peak Non-Repetitive Maximum Current	$I_{PKR} \times 1.5$
Test Voltage Terminal to Terminal $V_{TT}$	$1.5 * V_{NDC}$ for 10 seconds
Test Voltage Terminal to Case $V_{TC}$	2 k VAC – 50/60 Hz for 60 seconds
Endurance Test	500 hours + 500 hours at 1.25 x rated voltage at 85°C
	500 hours + 500 hours at 1.25 x operative voltage t 105°C
Damp Heat	IEC 60068-2-78
THB Test 85/85 with Voltage	250 and 310 $V_{NAC}$ version:
	240 VAC, 85°C/85% R.H. 500 hours: $\Delta C/C < 10\%$ and $ \Delta Tg  < 3 \cdot 10^{-3}$ at 1 kHz IR ≥ 50% initial limit
	350 and 400 $V_{NAC}$ version:
	310 VAC, 85°C/85% R.H. 500 hours: $\Delta C/C < 10\%$ and $ \Delta Tg  < 3 \cdot 10^{-3}$ at 1 kHz IR ≥ 50% initial limit
Change of Temperature	IEC 60068-2-14

## Operative Voltage Derating

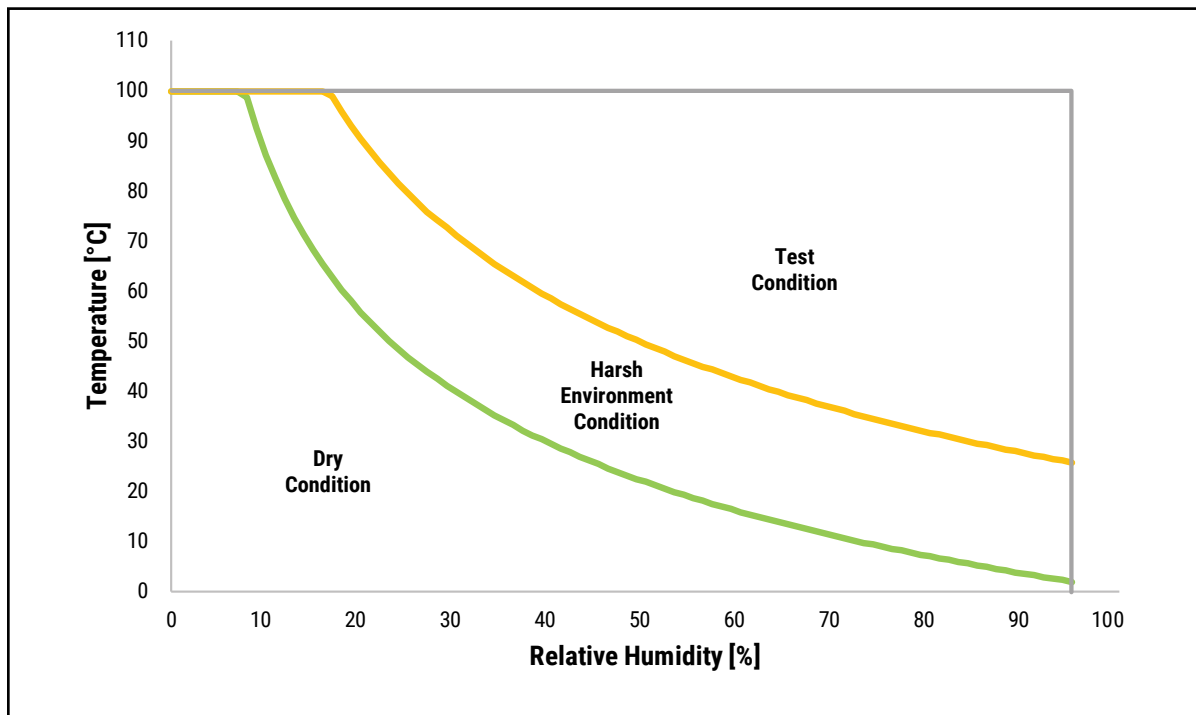

Operating Voltage	Voltage (VAC)			
	250	310	350	400
Rated Voltage at 85°C ( $T_{HS}$ )	250	310	350	400
Operating Voltage at 105°C ( $T_{HS}$ )	175	217	245	280

## Life Expectancy/Failure Quota\* Graphs

\* Evaluated considering an environmental conditions as dry condition.

## Environmental condition reference

## Life Expectancy/Failure Quota Graphs cont.

KEMET defines maximum ripple current, based on hot spot/ambient self-heating temperature. For C4AF, maximum allowed self-heating is 30°C, with ambient temperature up to 55°C. DT is reduced linearly with increasing ambient temperature, down to 0°C at 100°C (no self-heating allowed at maximum operating temperature):

$\Delta T_{HS Lim}$  vs. Ambient Temperature

## Power Losses & Hot Spot Temperature Calculation

At each frequency, the power losses are the sum of:

### 1. Dielectric power losses

$$P_D(f_i) = 2 * \pi * f_i * C * V(f_i)^2 * \text{tg}\delta_0$$

which can be alternatively calculated as

$$P_D(f_i) = \frac{I(f_i)^2}{2 * \pi * f_i * C} * \text{tg}\delta_0$$

where:

$$\text{tg}\delta_0 = 7 * 10^{-4} \text{ (maximum value)}$$

### 2. Joule power losses

$$P_J(f_i) = R_s * I(f_i)^2$$

The total power losses are the sum of the components at each frequency:

$$P_T = \sum_i [P_D(f_i) + P_J(f_i)]$$

The thermal jump in the hot spot is:

$$\Delta T_{HS} = P_T * R_{th}$$

The hot spot temperature is:

$$T_{HS} = T_a + \Delta T_{HS}$$

## Power Losses & Hot Spot Temperature Calculation cont.

### Limits for the formulas

The limits listed below should not be exceeded:

$$1. \sqrt{\sum_i V(f_i)^2} \leq VAC_{MAX}$$

$$2. \sqrt{\sum_i I(f_i)^2} \leq I_{RMS_{MAX}}$$

$$T_{HS} = T_a + \Delta T_{HS} \leq (T_{HS})_{MAX}$$

where  $T_a$  is the ambient temperature (steady state temperature of the cooling air flowing around the capacitor, measured at 100 mm of distance from the capacitor and at a height of 2/3 height of the capacitor).

### Example of calculation

P/N: C4AF9BW5100A3JK	$P_D(50) = 2 * \pi * 50 * 10 * 10^{-6} * 310^2 * 7 * 10^{-4} = 0.211 \text{ [W]}$
Rated $V_{RMS} = 310 \text{ [V}_{RMS}]$	$P_D(15,000) = [7.9^2 / (2 * \pi * 15,000 * 10 * 10^{-6})] * 7 * 10^{-4} = 0.0463 \text{ [W]}$
Rated $I_{RMS_{MAX}} = 16.6 \text{ [A]}$	$P_J(50) = 4.2 * 10^{-3} * [(2 * \pi * 50 * 10 * 10^{-6} * 310)^2] = 0.0398 \text{ [W]}$
$R_s = 4.2 \text{ [m}\Omega]$	$P_J(15000) = 4.2 * 10^{-3} * 7.9^2 = 0.262 \text{ [W]}$
$R_{th} = 18 \text{ [}^\circ\text{C/W]}$	$P_T = 0.211 + 0.0463 + 0.0398 + 0.262 = 0.5591 \text{ [W]}$
Fundamental Frequency $F_1 = 50 \text{ [Hz]}$	$\Delta T_{HS} = 18 * 0.559 = 10 \text{ [}^\circ\text{C]}$
Ripple Frequency $F_2 = 15,000 \text{ [Hz]}$	$T_{HS} = T_a + \Delta T_{HS}$
Fundamental Voltage $V_1 = 310 \text{ [V~]}$	$T_{HS} = 75 + 10 = 85 \text{ [}^\circ\text{C]} \gg \text{OK since hot spot temperature is less than maximum admitted}$
Ripple Current $I_2 = 7.9 \text{ [A]}$	Expected Life at $T_{HS} = 85^\circ\text{C} \gg 60,000 \text{ hours (see lifetime curve)}$
$T_a = 75^\circ\text{C}$	
$I_1 = I(50) = 2 * \pi * 50 * 10 * 10^{-6} * 310 = 0.973 \text{ [A]}$	
$V_2 = V(15,000) = [7.9 / (2 * \pi * 15,000 * 10 * 10^{-6})] = 8.4 \text{ [V]}$	

## Environmental Compliance

As an environmentally conscious company, KEMET is working continuously to improve the environmental effects of both our capacitors and their production.

In Europe, due to the RoHS Directive, and in some other geographical areas such as China, legislation has been put in place to prevent the use of some hazardous materials, including lead (Pb) in electronic equipment. All products in this catalog are produced to help our customers' obligations to guarantee their products to fulfill these legislative requirements. The only material of concern in our products has been lead (Pb), which has been removed from all designs to fulfill the requirement of containing less than 0.1% of lead in any homogeneous material.

KEMET will closely follow any changes in legislation on a global basis and make any necessary changes to its products whenever needed.

Some customer segments including medical, defense and automotive electronics may still require the use of lead in electrode coatings. To clarify the situation and distinguish products, the following symbols are used on the packaging labels for RoHS compliant and Pb-free capacitors.

Due to customer requirements, additional markings such as lead-free (LF) or lead-free wires (LFW) may appear on the packaging label.

---

## Materials & Environment

The selection of materials used by KEMET for the production of capacitors is the result of extensive experience and constant attention to environmental protection. KEMET selects its suppliers according to ISO 9001 standards and carries out statistical analysis on the materials purchased before the acceptance. All the materials, to the company's present knowledge, are non-toxic and free from cadmium, mercury, chrome and compounds, polychlorine triphenyl (PCB), bromide and chlorine dioxins bromurate chlorurate, CFC and HCFC, and asbestos.

All KEMET power film products are RoHS compliant.

## Insulation Resistance

As the capacitor temperature increases, the insulation resistance decreases. This is due to the increased electron activity. Low insulation resistance can also be the result of moisture trapped in the windings, caused by a prolonged exposure to excessive humidity.

## Dissipation Factor

Dissipation factor is a complex function involved with the inefficiency of the capacitor. The  $\tan\delta$  may change up and down with increased temperature. For more information, please refer to Performance Characteristics.

## Sealing

### Hermetically Sealed Capacitors

As the temperature increases, the pressure inside the capacitor increases. If the internal pressure is high enough, it can cause a breach in the capacitor, which can result in leakage, impregnation, filling fluid or moisture susceptibility.

### Resin Encased/Wrap & Fill Capacitors

The resin seals on resin-encased and wrap-and-fill capacitors will withstand short-term exposure to high humidity environments without degradation. Resins and plastic tapes will form a pseudo-impervious barrier to humidity and chemicals. These case materials are somewhat porous and through osmosis can cause contaminants to enter the capacitor. The second area of contaminated absorption is the lead-wire/resin interface. Since resins cannot bond 100% to tinned wires, there can be a path formed up to the lead wire into the capacitor section. Aqueous cleaning of circuit boards can aggravate this condition.

### Barometric Pressure

The altitude at which hermetically sealed capacitors are operated, controls the voltage rating of the capacitor. As the barometric pressure decreases, the susceptibility to terminal arc-over increases. Non-hermetic capacitors can be affected by internal stresses due to pressure changes. This can be in the form of capacitance changes, or dielectric arc-over, as well as low insulation resistance. Heat transfer can also be affected by altitude operation. Heat, generated in an operation, cannot be dissipated properly and can result in high RI2 losses and eventual failure.

### Radiation

Radiation capabilities of capacitors must be taken into consideration. Electrical degradation in the form of dielectric embitterment can take place causing shorts or opens.

(\*) Current corresponding to 30°C of self-heating in dry conditions and composed by nominal 50 Hz current at rated VAC plus 10 kHz overlapped harmonics. For Expected Life and FIT performances, please refer always to the Curves reported inside the data-sheet based on working voltage and hot spot temperatures

## Soldering Process

The implementation of the RoHS directive has resulted in the selection of SnAgCu (SAC) alloys or SnCu alloys as primary solder. This has increased the liquidus temperature from that of 183°C for SnPb eutectic alloy to 217 – 221°C for the new alloys. As a result, the heat stress to the components, even in wave soldering, has increased considerably due to higher pre-heat and wave temperatures. Polypropylene capacitors are especially sensitive to heat (the melting point of polypropylene is 160 – 170°C). Wave soldering can be destructive, especially for mechanically small polypropylene capacitors (with lead spacing of 5 mm to 15 mm), and great care has to be taken during soldering. The recommended solder profiles from KEMET should be used. Please consult KEMET with any questions. In general, the wave soldering curve from IEC Publication 61760-1 Edition 2 serves as a solid guideline for successful soldering. Please see Figure 1.

Reflow soldering is not recommended for through-hole film capacitors. Exposing capacitors to a soldering profile in excess of the above the recommended limits may result to degradation or permanent damage to the capacitors.

Do not place the polypropylene capacitor through an adhesive curing oven to cure resin for surface mount components. Insert through-hole parts after the curing of surface mount parts. Consult KEMET to discuss the actual temperature profile in the oven, if through-hole components must pass through the adhesive curing process. A maximum two soldering cycles is recommended. Please allow time for the capacitor surface temperature to return to a normal temperature before the second soldering cycle.

### Manual Soldering Recommendations

Following is the recommendation for manual soldering with a soldering iron.

The soldering iron tip temperature should be set at 350°C (+10°C maximum) with the soldering duration not to exceed more than 3 seconds.

### Wave Soldering Recommendations

## Soldering Process cont'd

### Wave Soldering Recommendations cont'd

1. The table indicates the maximum set-up temperature of the soldering process.

Figure 1

Dielectric Film Material	Maximum Preheat Temperature			Maximum Peak Soldering Temperature	
	Capacitor Pitch ≤ 10 mm	Capacitor Pitch = 15 mm	Capacitor Pitch > 15 mm	Capacitor Pitch ≤ 15 mm	Capacitor Pitch > 15 mm
Polyester	130°C	130°C	130°C	270°C	270°C
Polypropylene	100°C	110°C	130°C	260°C	270°C
Paper	130°C	130°C	140°C	270°C	270°C
Polyphenylene Sulphide	150°C	150°C	160°C	270°C	270°C

2. The maximum temperature measured inside the capacitor:

Set the temperature so that inside the element the maximum temperature is below the limit:

Dielectric Film Material	Maximum temperature measured inside the element
Polyester	160°C
Polypropylene	110°C
Paper	160°C
Polyphenylene Sulphide	160°C

*Temperature monitored inside the capacitor.*

### Selective Soldering Recommendations

Selective dip soldering is a variation of reflow soldering. In this method, the printed circuit board with through-hole components to be soldered is preheated and transported over the solder bath as in normal flow soldering without touching the solder. When the board is over the bath, it is stopped and pre-designed solder pots are lifted from the bath with molten solder only at the places of the selected components, and pressed against the lower surface of the board to solder the components.

The temperature profile for selective soldering is similar to the double wave flow soldering outlined in this document, **however, instead of two baths, there is only one bath with a time from 3 to 10 seconds.** In selective soldering, the risk of overheating is greater than in double wave flow soldering, and great care must be taken so that the parts are not overheated.

### Disclaimer

All product specifications, statements, information and data (collectively, the "Information") in this datasheet are subject to change. The customer is responsible for checking and verifying the extent to which the Information contained in this publication is applicable to an order at the time the order is placed.

All Information given herein is believed to be accurate and reliable, but it is presented without guarantee, warranty, or responsibility of any kind, expressed or implied.

Statements of suitability for certain applications are based on KEMET Electronics Corporation's ("KEMET") knowledge of typical operating conditions for such applications, but are not intended to constitute – and KEMET specifically disclaims – any warranty concerning suitability for a specific customer application or use. The Information is intended for use only by customers who have the requisite experience and capability to determine the correct products for their application. Any technical advice inferred from this Information or otherwise provided by KEMET with reference to the use of KEMET's products is given gratis, and KEMET assumes no obligation or liability for the advice given or results obtained.

Although KEMET designs and manufactures its products to the most stringent quality and safety standards, given the current state of the art, isolated component failures may still occur. Accordingly, customer applications which require a high degree of reliability or safety should employ suitable designs or other safeguards (such as installation of protective circuitry or redundancies) in order to ensure that the failure of an electrical component does not result in a risk of personal injury or property damage.

Although all product-related warnings, cautions and notes must be observed, the customer should not assume that all safety measures are indicated or that other measures may not be required.
